(54) Title: DEVICE FOR MONITORING DIASTEMA IN ORTHODONTICS TREATMENT

(57) Abstract: The invention of the device of monitoring deviations and fractures of the teeth, and detecting the amount of facial deviations with contribution of images and changes to each of the facial parts during treatment in the field of dentistry which is done with the help of a camera mounted on the leg and the adjuster tool which is placed on the mouth as well as adjuster legs which are placed on the forehead of the person, and a laser indicates the position of the face; different movies and pictures will be made during different steps. In addition, with the help of the cloud of points, the pictures will be overlaid so the problem of not fitting the teeth will be properly met since during the treatment, the dentist can determine the amount of orthodontic changes in the tooth, and the amount of stretching in different points. With the help of the imaging system and by finding the point of symmetry of the face and dropping the red laser line, the amount of deviations of the face, especially nose, and the size will be measured for each point that the physician determ
